

# Stable Boy® Horse Stall Kit

Equine Equipped introduces the industry's first professionally designed and manufactured toy hauler-to-horse trailer conversion kit. The Stable Boy® horse stall system is made of high-quality, heavy gage, corrosive resistant aluminum. The modular design allows for multiple configurations for one or two horses. When you take out the left stall divider and haul one horse there is enough room to bring along a golf cart, motorcycle, ATV etc.

We recommend a 5<sup>th</sup> wheel Toy Hauler with a 12 foot garage for the Stable Boy® Kit. Any make or model toy hauler can be used. The Toy Hauler can be purchased new or used. A 10 foot or 11 foot garage will work, however, there will not be enough room to exit the stall under the left manger door. The dimensions of the entire kit are 75 inches wide by 115 inches long by 76 inches tall. Each stall opening is 35 inches wide. The garage for most 12 foot Toy Haulers have a carrying weight capacity 3500 to 4500 pounds. The Stable Boy® kit weighs approx. 680 lbs.

Toy hauler RV's are constructed heavier as the functional purpose is to haul cargo (ATV's, motorcycles, snowmobiles etc..). Toy Haulers are well designed to haul this cargo. They contain more steel supports within the floor, walls and rear opening. When Stable Boy® horse stall kit is installed in the garage area the horses are confined comfortably within the stalls. This restricts movement just like a horse trailer. It is important to match the weight of your horses to the capacity of the Toy Hauler cargo or garage area.

There is some initial installation required for the dovetail assembly. The dovetail is a ¼" thick diamond plate material that allows the ramp of the garage to convert to a level floor. The diamond plate dovetail stays in the Toy Hauler garage. The dovetail assembly is hinged and can be lowered to convert the floor back to a ramp. This provides versatility for the garage to be used for wheeled vehicles. A 4 foot by 8 foot piece of aluminum plate is also included in the kit. This plate is installed on the floor under the kit, and is intended to stay in the Toy Hauler. The plate is used for the Stable Boy® horse stall frame and provides additional reinforcement

The full kit includes the two horse stalls, the mangers, dovetail, floor frame, floor plate, ramp mat, stall mats, remote control ceiling fan, side vents, 2 place saddle racks mounted on the lower left manger door and the Stable Boy® cart. A ramp mat is added to ensure the horses have safe, comfortable footing when loading. If desired, the additional side vents and ceiling fan can be used for increased airflow. Most Toy haulers have several windows as well as air conditioning in the garage area. The compact Stable Boy® cart is an added benefit as it allows for easy storage and transportation of the disassembled Kit. The entire kit will fit on the compact Stable Boy® cart making it a convenient way to move the kit to the barn or garage for storage. The full kit sells for \$8600 during this introductory period. If you would like to view the video showing the process for the one time installation for the dovetail, let us know.
